COVID-19 Weekly Surveillance Report

14th April 2022

Public Health Directorate

Introduction

This report is a summary of indicators which are used to understand the dynamics of the spread of COVID-19 on the Isle of Man.

This report will be published each Thursday for data up to and including the previous Sunday e.g. 12th August is for data up to 8th August.

The COVID-19 results are a combination of positive PCR and LFT tests.

The report has been compiled by the Public Health Intelligence Team using data from Manx Care, the Civil Registry and the Lateral Flow Test (LFT) system.

Wave Surveillance

- This week saw a further fall in case numbers which has been seen across all age groups. This is reflected by a further fall in the reproduction number to 0.64 from last week's 0.68, indicating continued slowing in transmission.

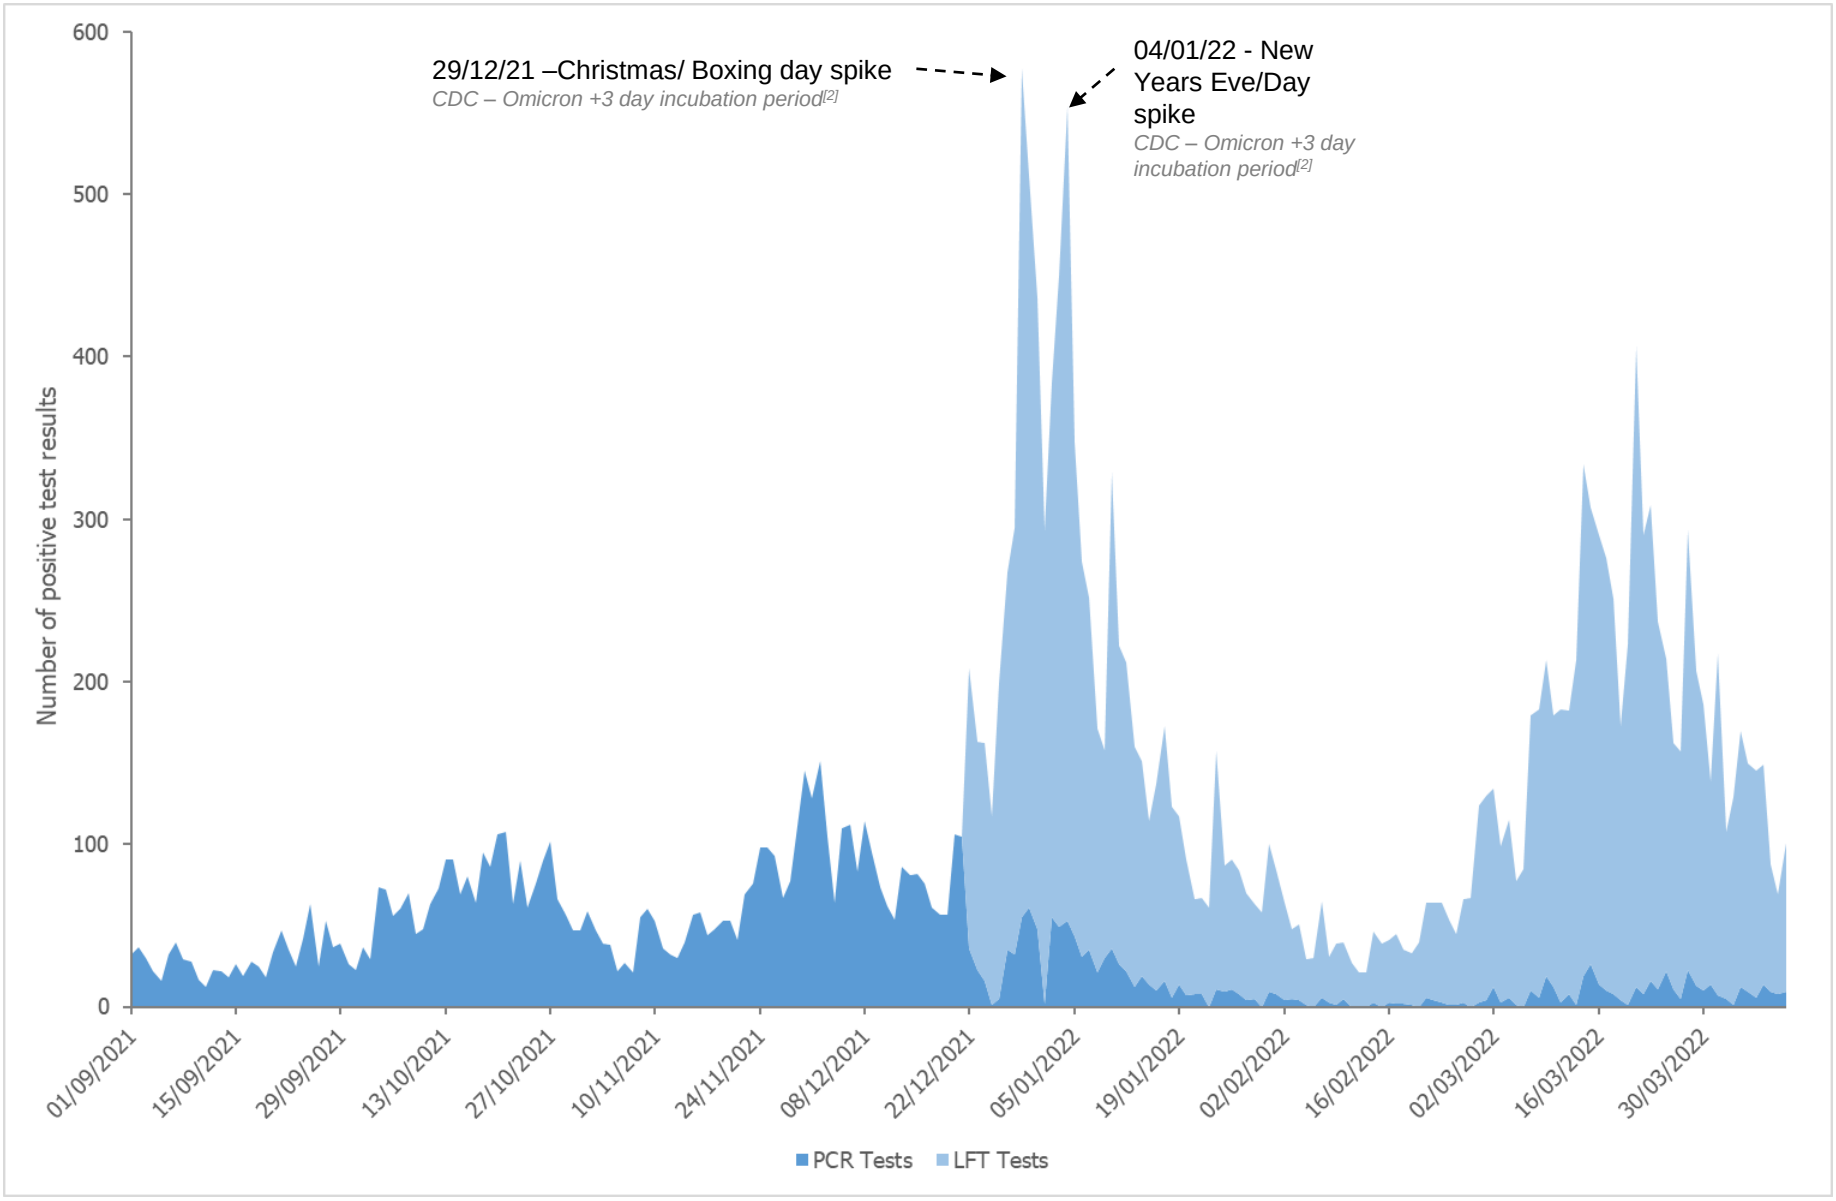

- Case ascertainment and calculation of the reproduction number is, of course, dependent on patterns of testing and reporting so it is likely that there are more cases than are currently notified. This caveat has applied throughout the pandemic when COVID has been transmitting on Island, although the change to LFD self testing and self reporting may have impacted on that to an unknown extent. Further changes to testing guidance published on 1 April may have an additional impact. This week we have seen a fall in seven day average daily reporting from 182 to 124 which may reflect a fall of in testing and reporting and/or continued fall in new case numbers. However, as the majority of omicron infections are mild, case numbers per se are now a less important measure than pressure on health and care services.

- As expected, our level and pattern of transmission is very similar to that across the UK. This is likely to result from increased travel, changes in patterns of behaviour and mixing following reduction of restrictions here and elsewhere and the increased transmissibility of the BA.2 variant of omicron which is now widespread here and across the British Isles. How long this persists will depend on levels of immunity, patterns of mixing in our communities and travel, all of which have an impact on transmission. However, in the absence of new variants of concern, we would expect a plateauing and subsequent fall in cases as the current BA.2 omicron wave passes through the susceptible population and we move into Spring and Summer. Our current continuing trend towards plateauing/falling case numbers supports this.

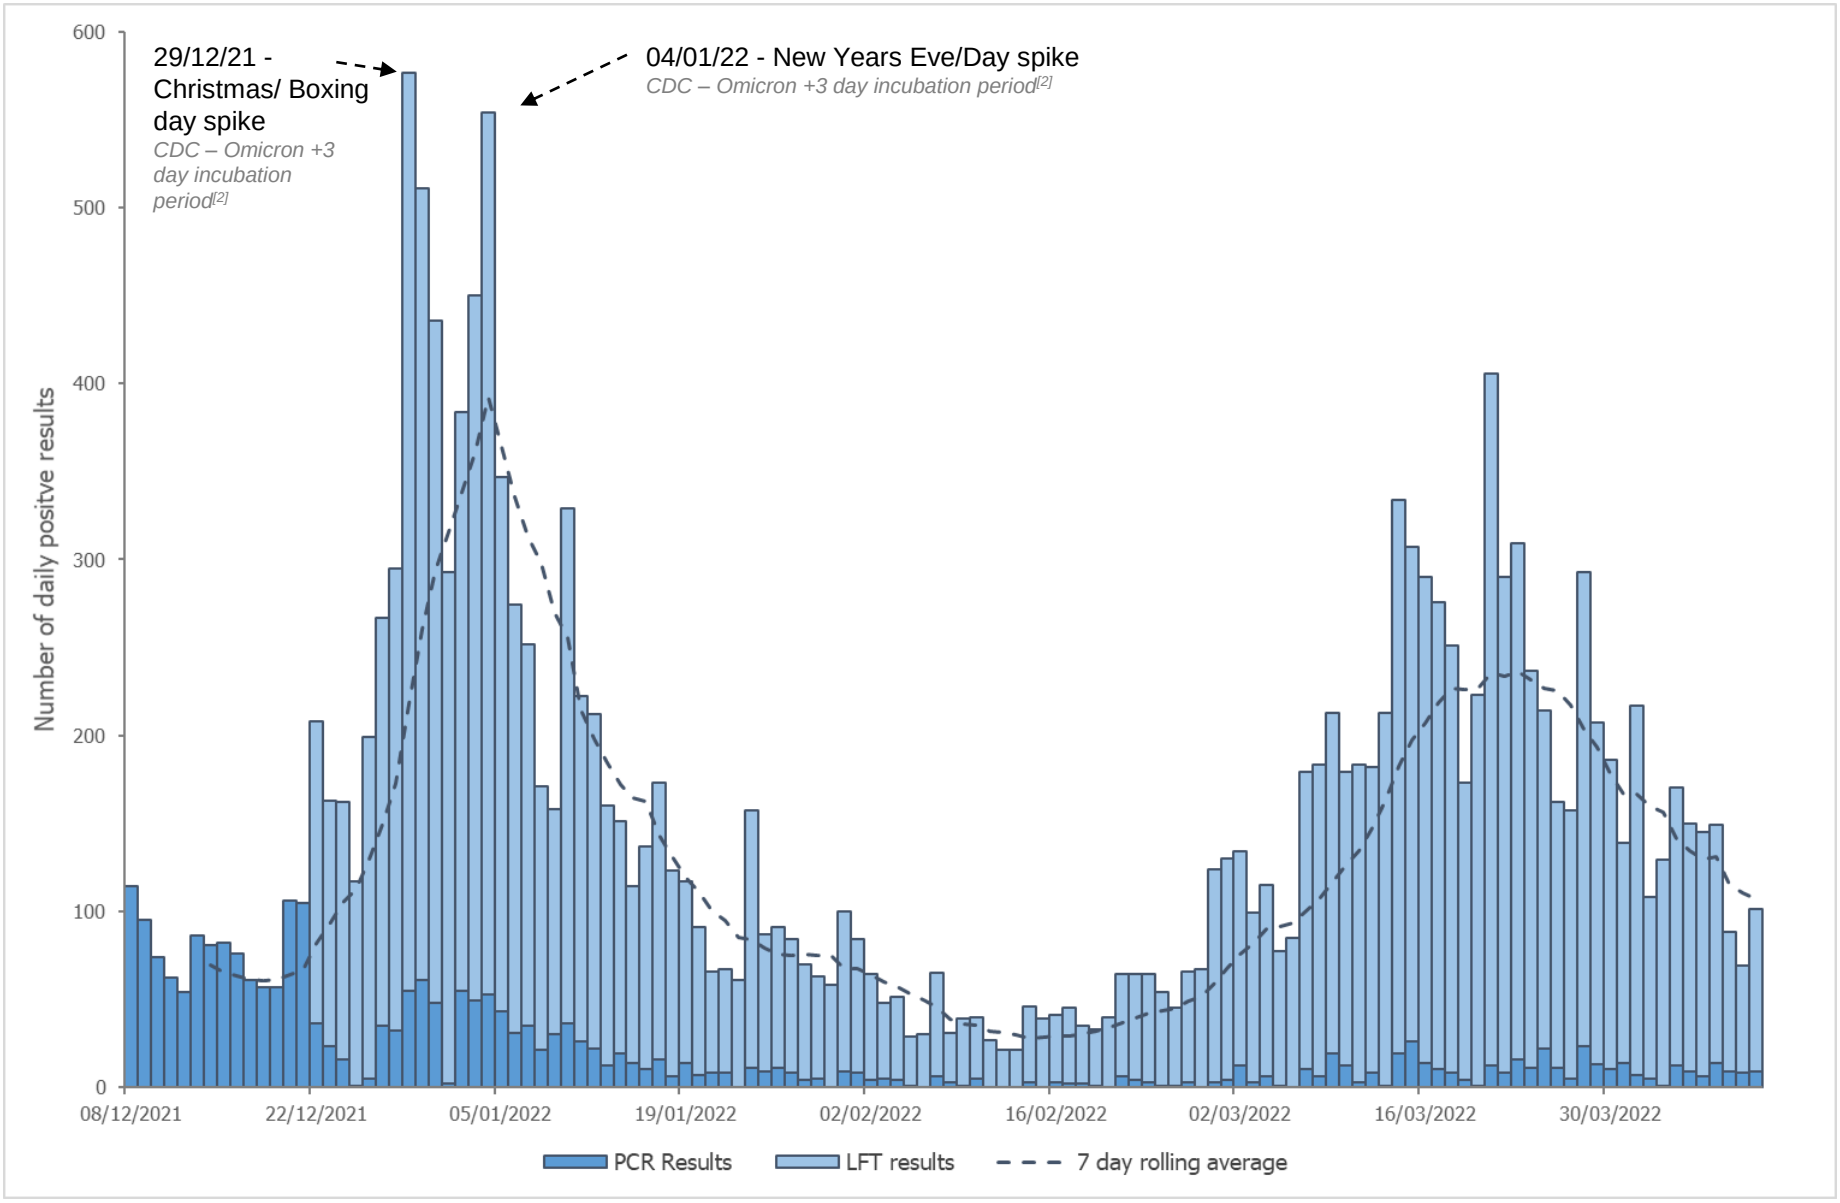

Key Points

- The current 7-day average for reported positive results is 124.
- The current trend of reported positive results is decreasing.
- The effective reproduction number (R_t) was 0.64 this week, indicating a further slowing in transmission.
- The snapshot of the Hospital shows 16 patients currently admitted with a COVID positive status.

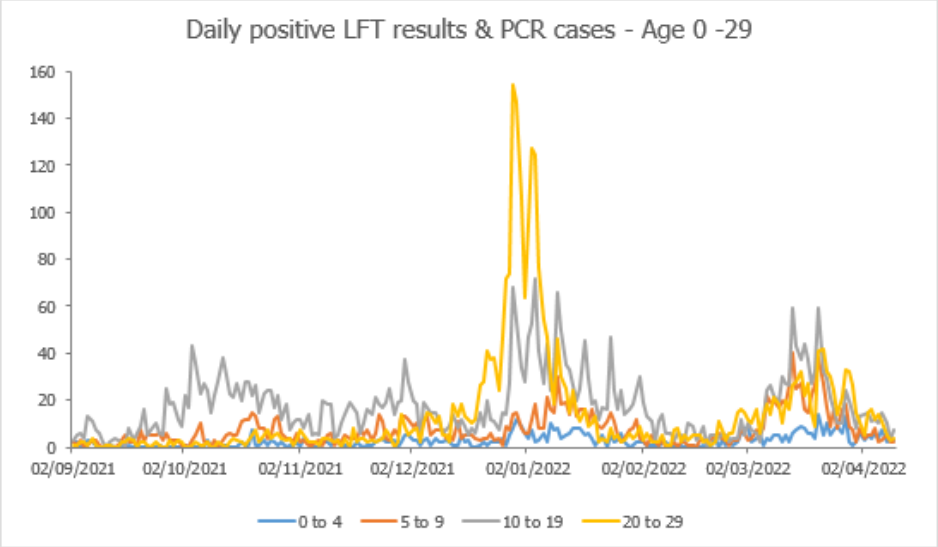

Positive COVID-19 Tests

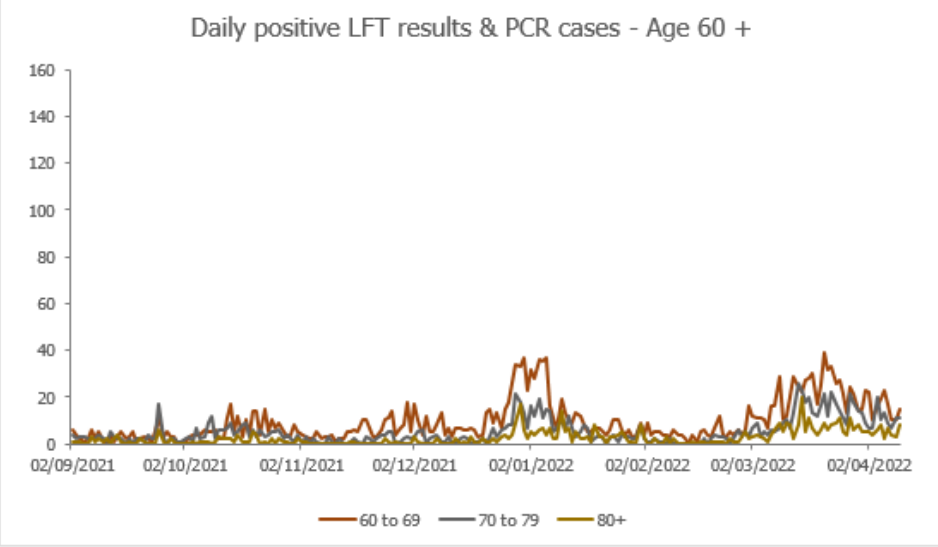

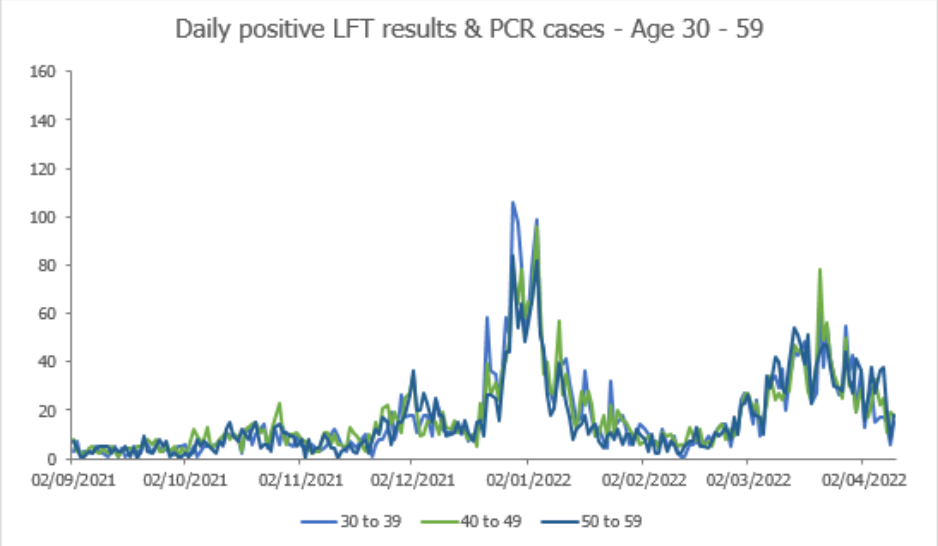

Daily Positive Results – 4th Wave

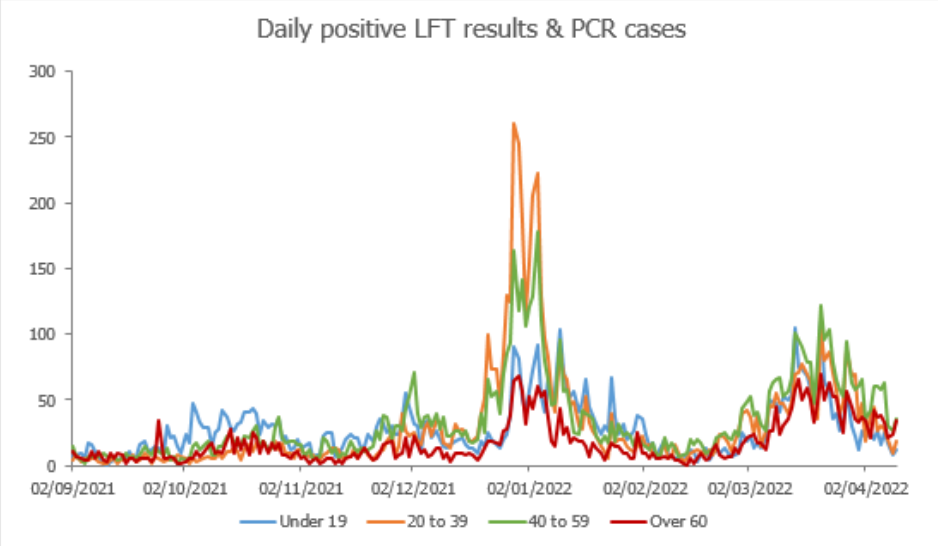

Age Group Analysis

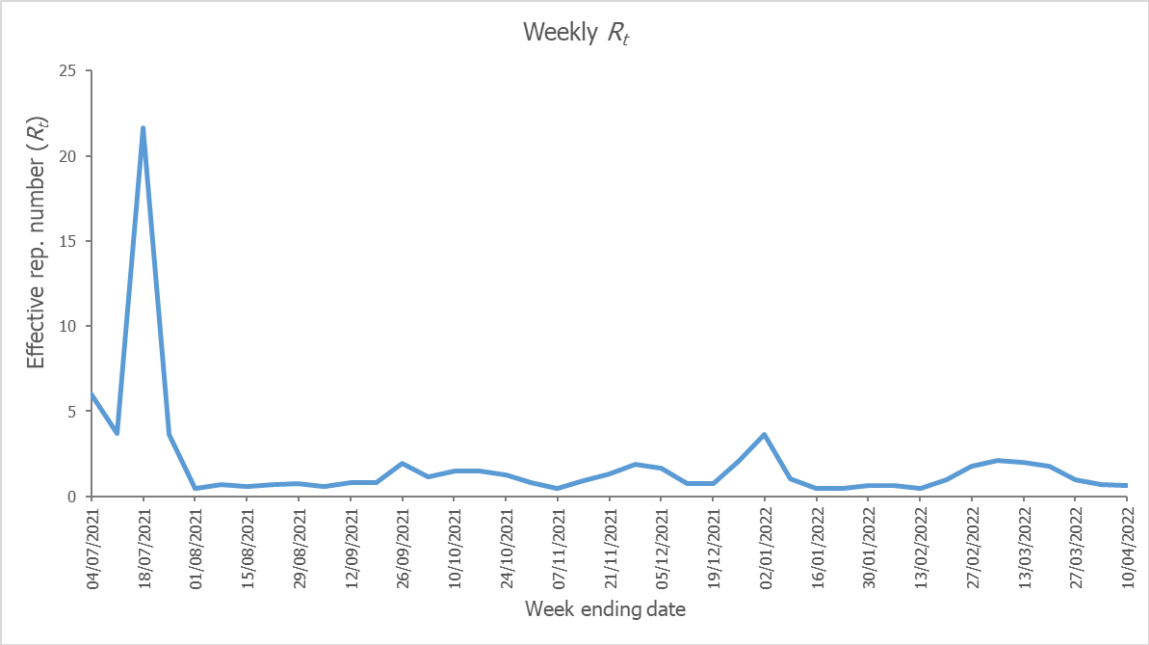

Effective Reproduction Number (R_t)

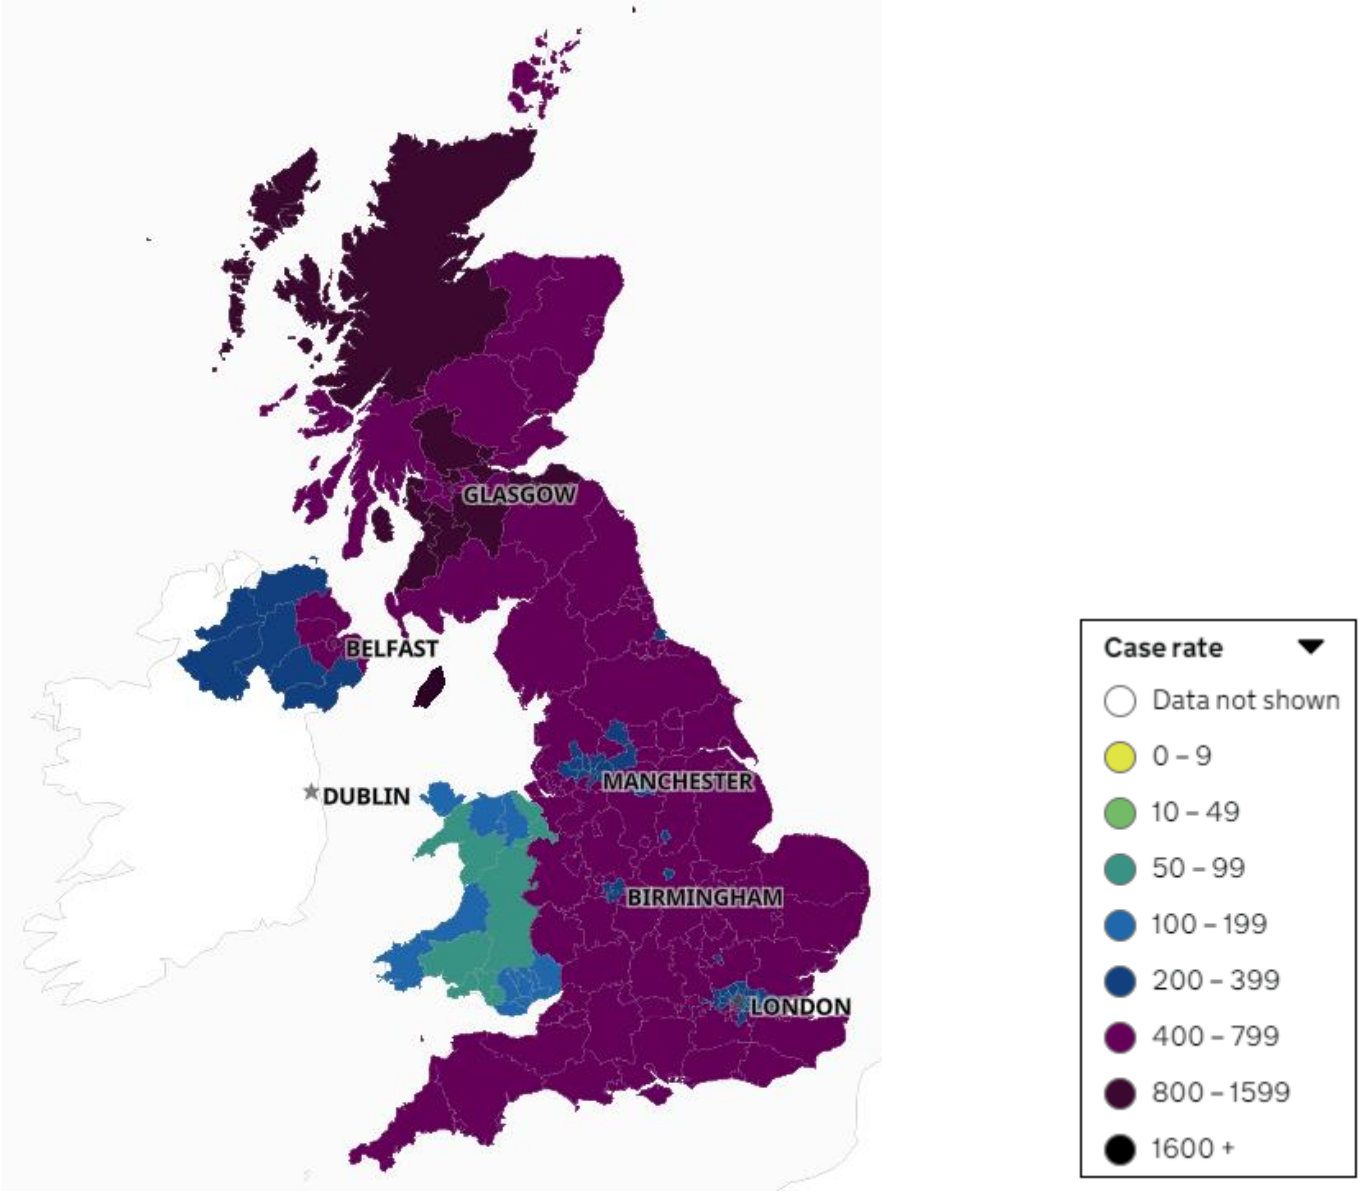

Latest 7 day
R_t = 0.64

- The Effective Reproduction Number (R_t) represents the number of secondary infections generated by each case over time 't' (over a week as presented here) and can be dramatically modified by applying effective interventions.
- When $R_t > 1$ there are more new infections than recoveries, thus the number of infected individuals in the population is increasing, while for $R_t < 1$ the number of infected individuals must be decreasing for the opposite reason.
- The calculation of R_t is as follows[1]:

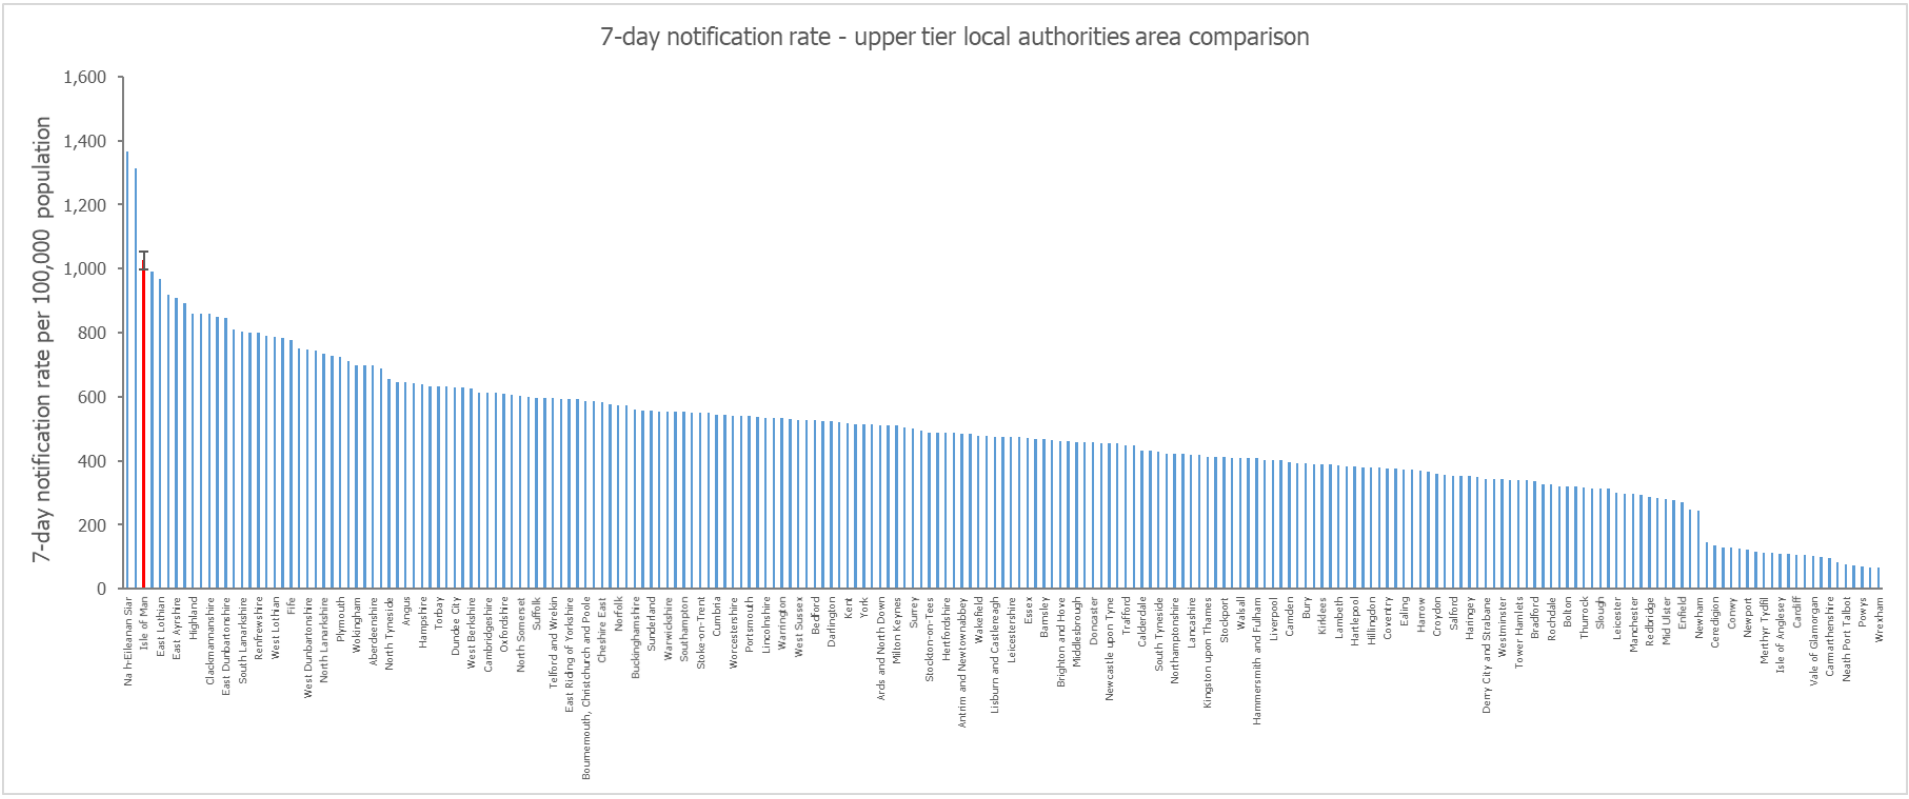

$$R_t\,(t_i) = \frac{\text{New Infections}}{\text{New Recoveries} + \text{New Deaths}}$$

- The UK uses a more complex method of estimating R_t which we are not able to replicate here. The use of this simplified methodology limits the robustness of comparing our R_t value with UK estimates, however it provides a useful comparison between different time periods on Island. New Recoveries is calculated using the presumed 10 day recovery period from positive test result.
- A full table of daily R_t values for the current wave is available in Appendix 1.

7-day Notification Rate Area Comparison

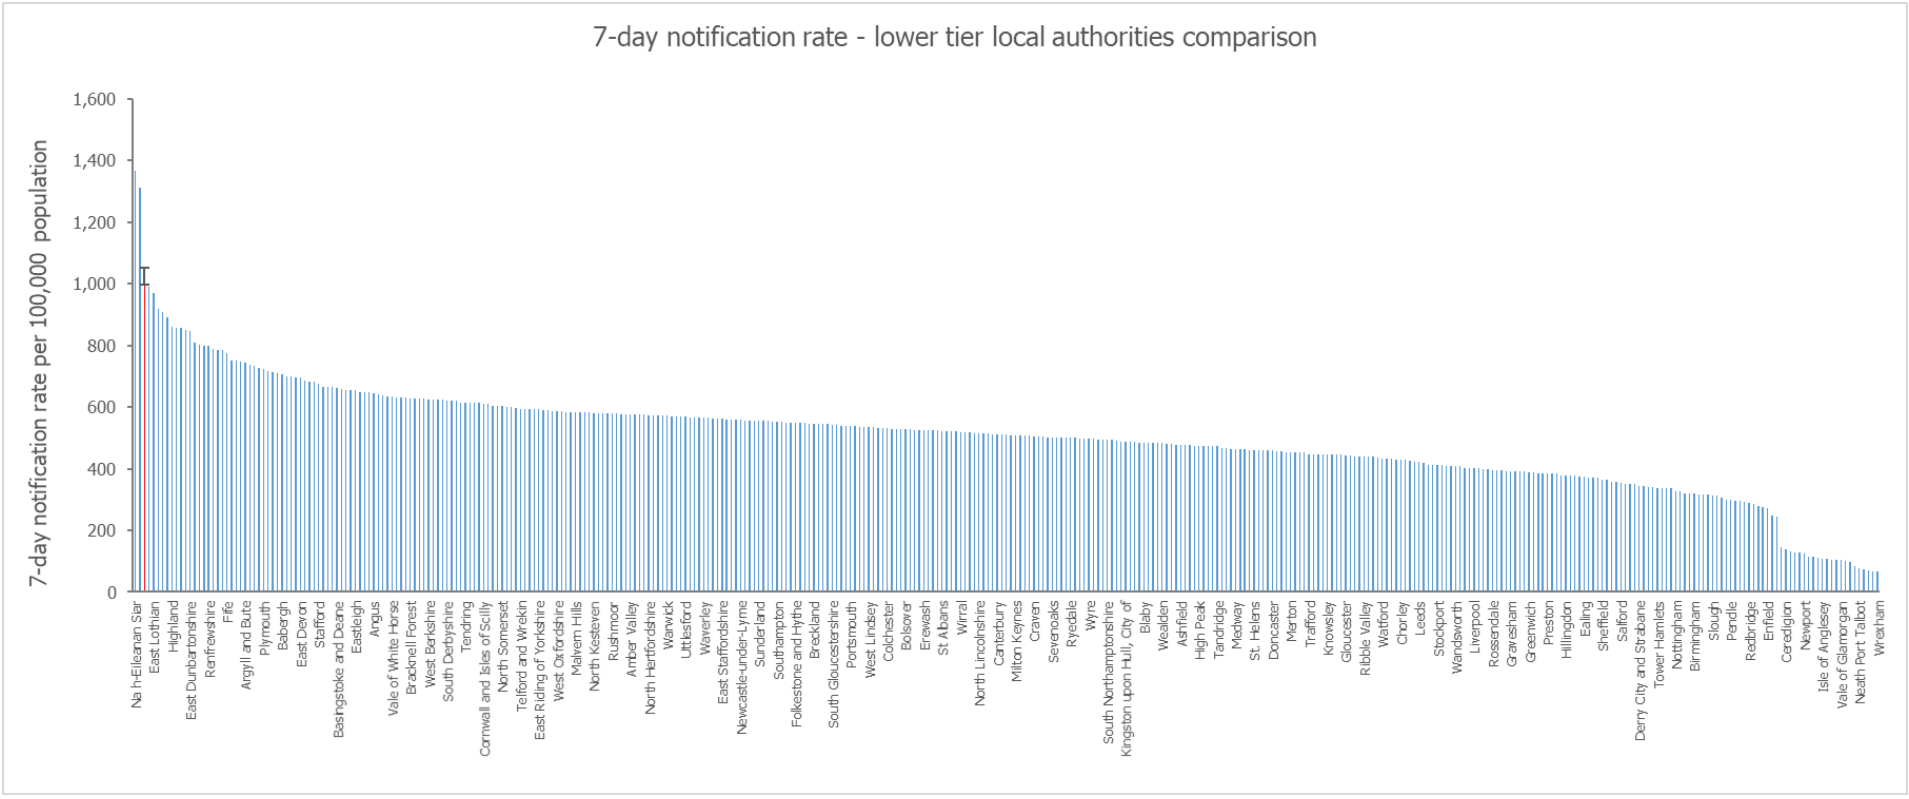

7-day Notification Rate – Upper Tier LA Comparison

The Isle of Man (shown in red), has the 3rd highest 7-day notification rate per 100,000 population when included in the upper tier local authorities of the UK.

7-day Notification Rate – Lower Tier LA Comparison

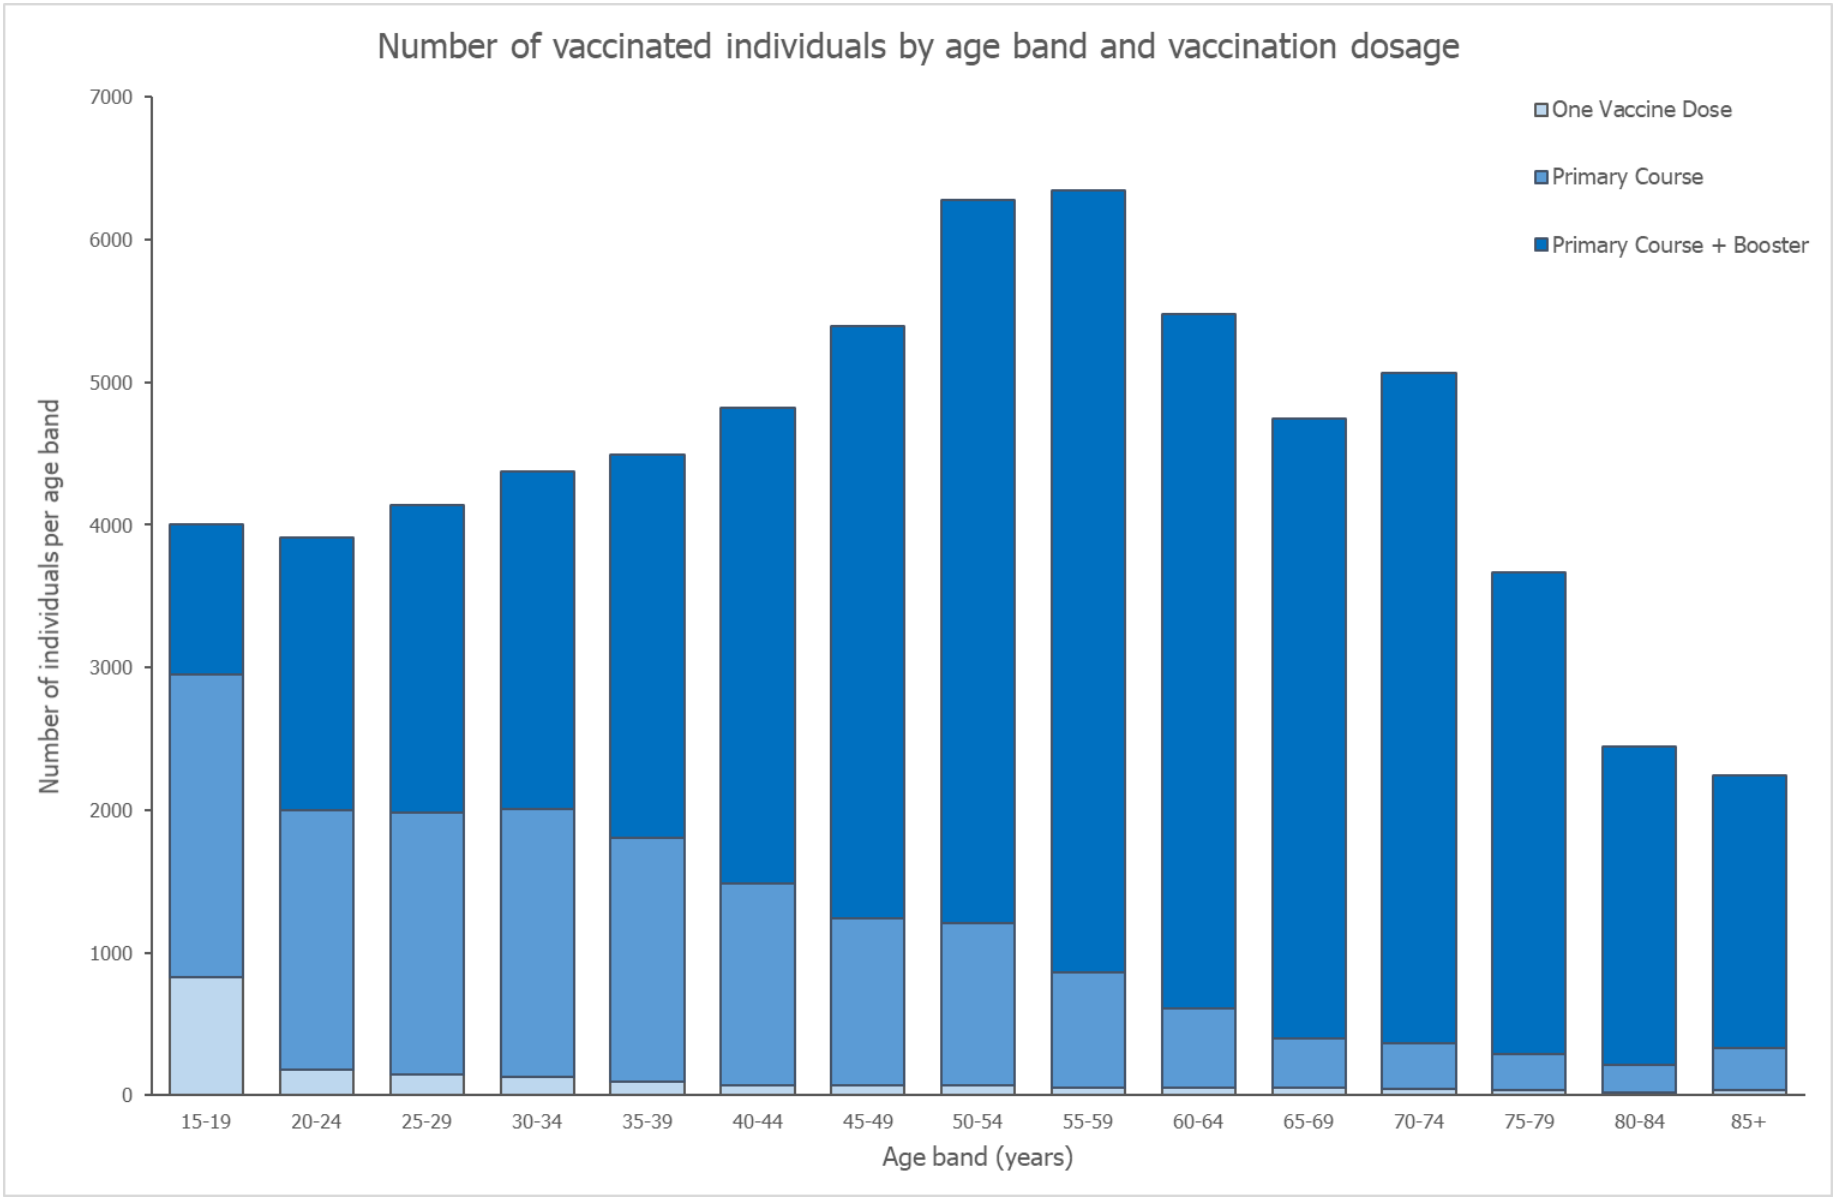

The Isle of Man (shown in red), has the 3rd highest 7-day notification rate per 100,000 population when included in the lower tier local authorities of the UK.

14-day Notification Rate Comparison

		Isle of Man			United Kingdom
Year	Week number	14 day rate	Lower CI	Upper CI	14 day rate

	5	1193 . 67	1176 . 69	1210 . 65	1594 . 05
	6	759 . 71	747 . 32	772 . 11	1429 . 55
	7	617 . 41	611 . 64	623 . 19	1179 . 00
	8	830 . 28	823 . 86	836 . 69	791 . 47
	9	1397 . 12	1381 . 42	1412 . 82	939 . 69
	10	2461 . 43	2437 . 40	2485 . 45	1293 . 95
	11	3743 . 30	3714 . 64	3771 . 95	1415 . 20
	12	4267 . 81	4230 . 67	4304 . 94	1357 . 28
	13	3951 . 91	3548 . 23	3634 . 95	1691 . 45
	14	2529 . 64	2498 . 87	2560 . 41	-

The 14-day rate is calculated by totalling new confirmed cases over the past 14-day period, dividing this number by the total population, and then multiplying by 100,000 to enable area comparisons.

Vaccine Uptake and Coverage

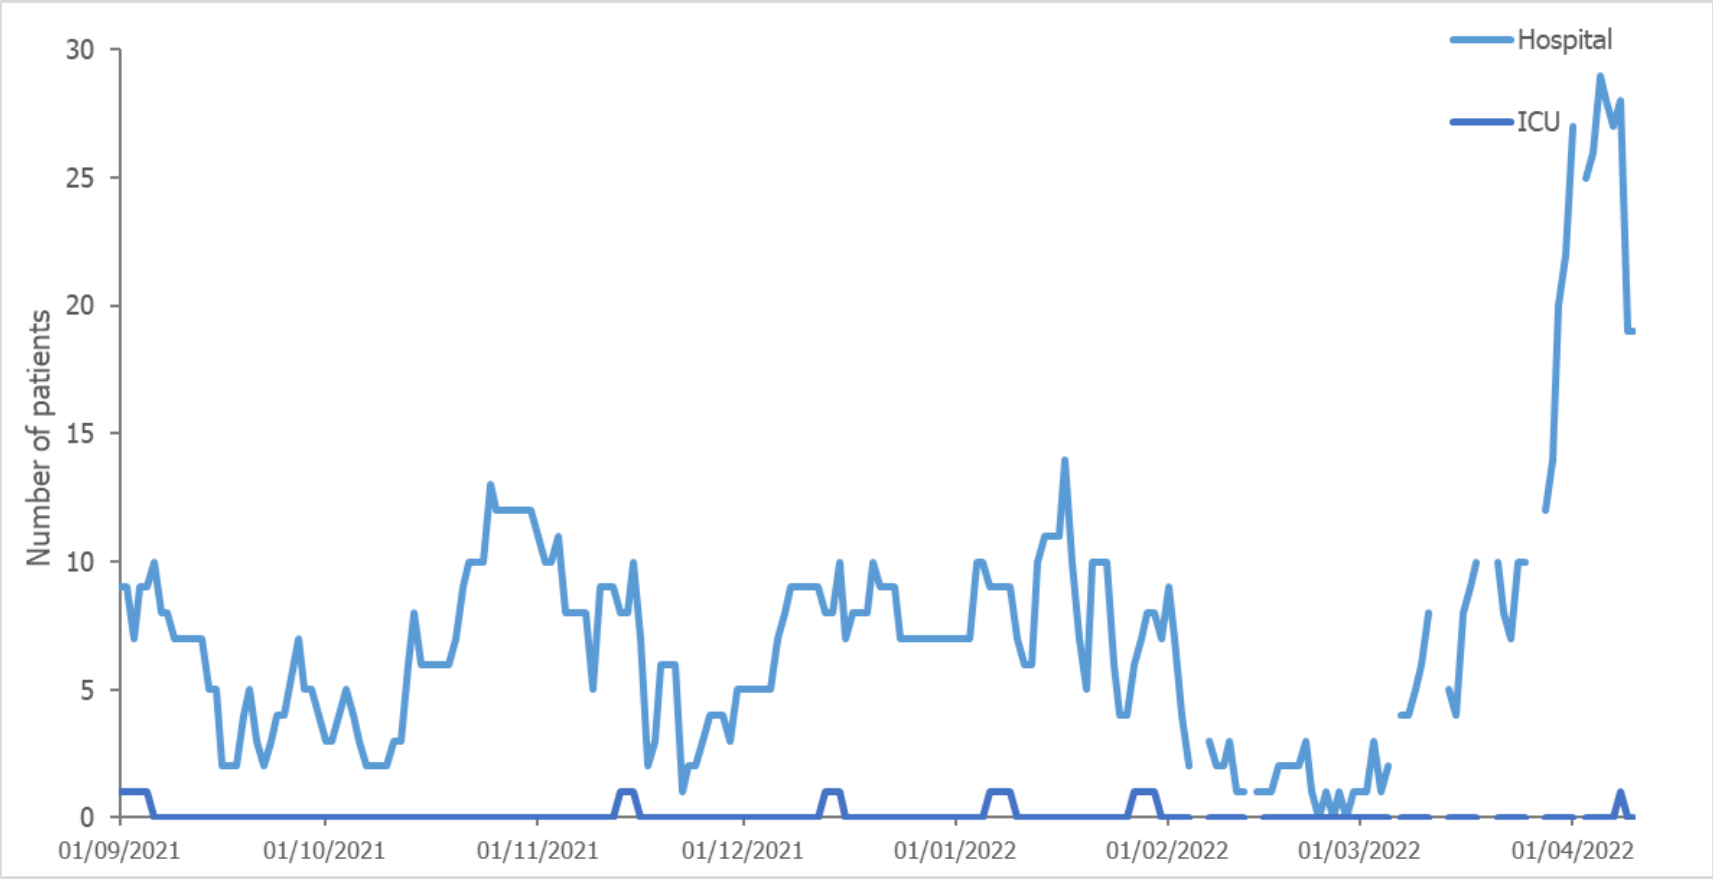

Vaccine Uptake and Coverage

This data uses the 2021 Census populations as reference for eligible population[3].

Hospitalised Patients

Patients in hospital with a confirmed COVID-positive status at the time of the daily snapshot, taken at 12pm.

Hospitalised Patients

SUMMARY

Total Patients	**16**

Vaccination Status of Hospital Admissions	
Primary Course + Booster	50%
Primary Course	13%
One Vaccine Dose	25%
Unvaccinated	13%

Snapshot – 12/04/22

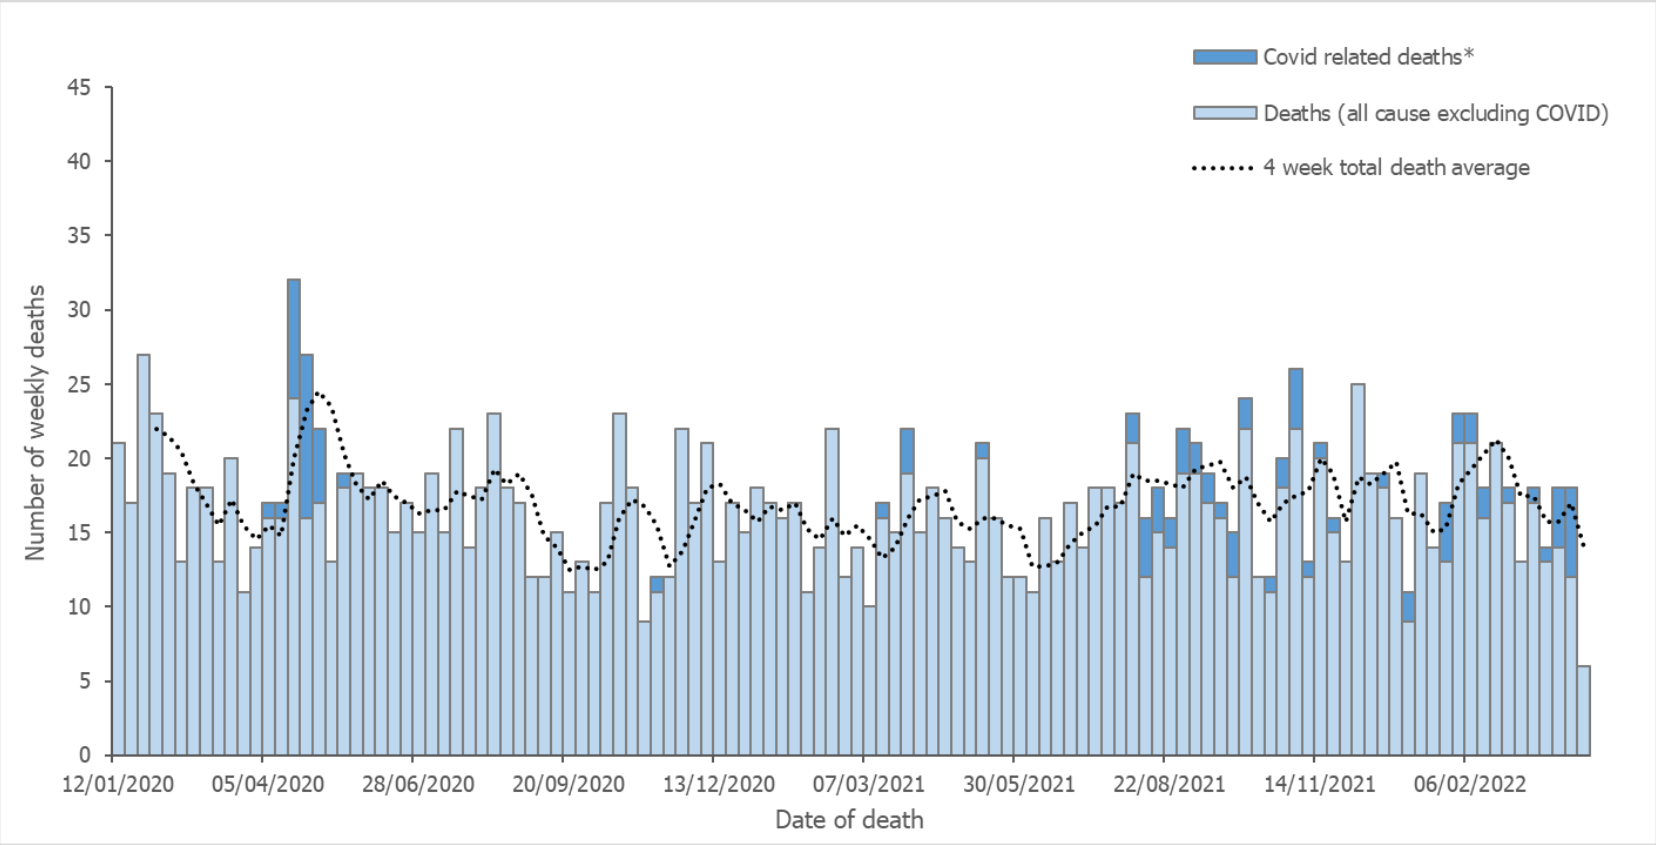

Hospitalised Patients

The following information has been supplied by Manx Care:

- At the time of information provision, there are 12 patients currently in Nobles Hospital who have tested positive for COVID-19.
- Of these, 12 have community acquired infection: 6 were admitted for treatment of their COVID-19 infection and 8 were admitted for other reasons and tested positive on admission.
- There were no patients with hospital acquired infection.

Please note, patient numbers may be differ to the daily snapshot totals due to changes in hospital numbers between the snapshot time (12pm) and time of information provision.

Weekly Deaths – Whole Pandemic

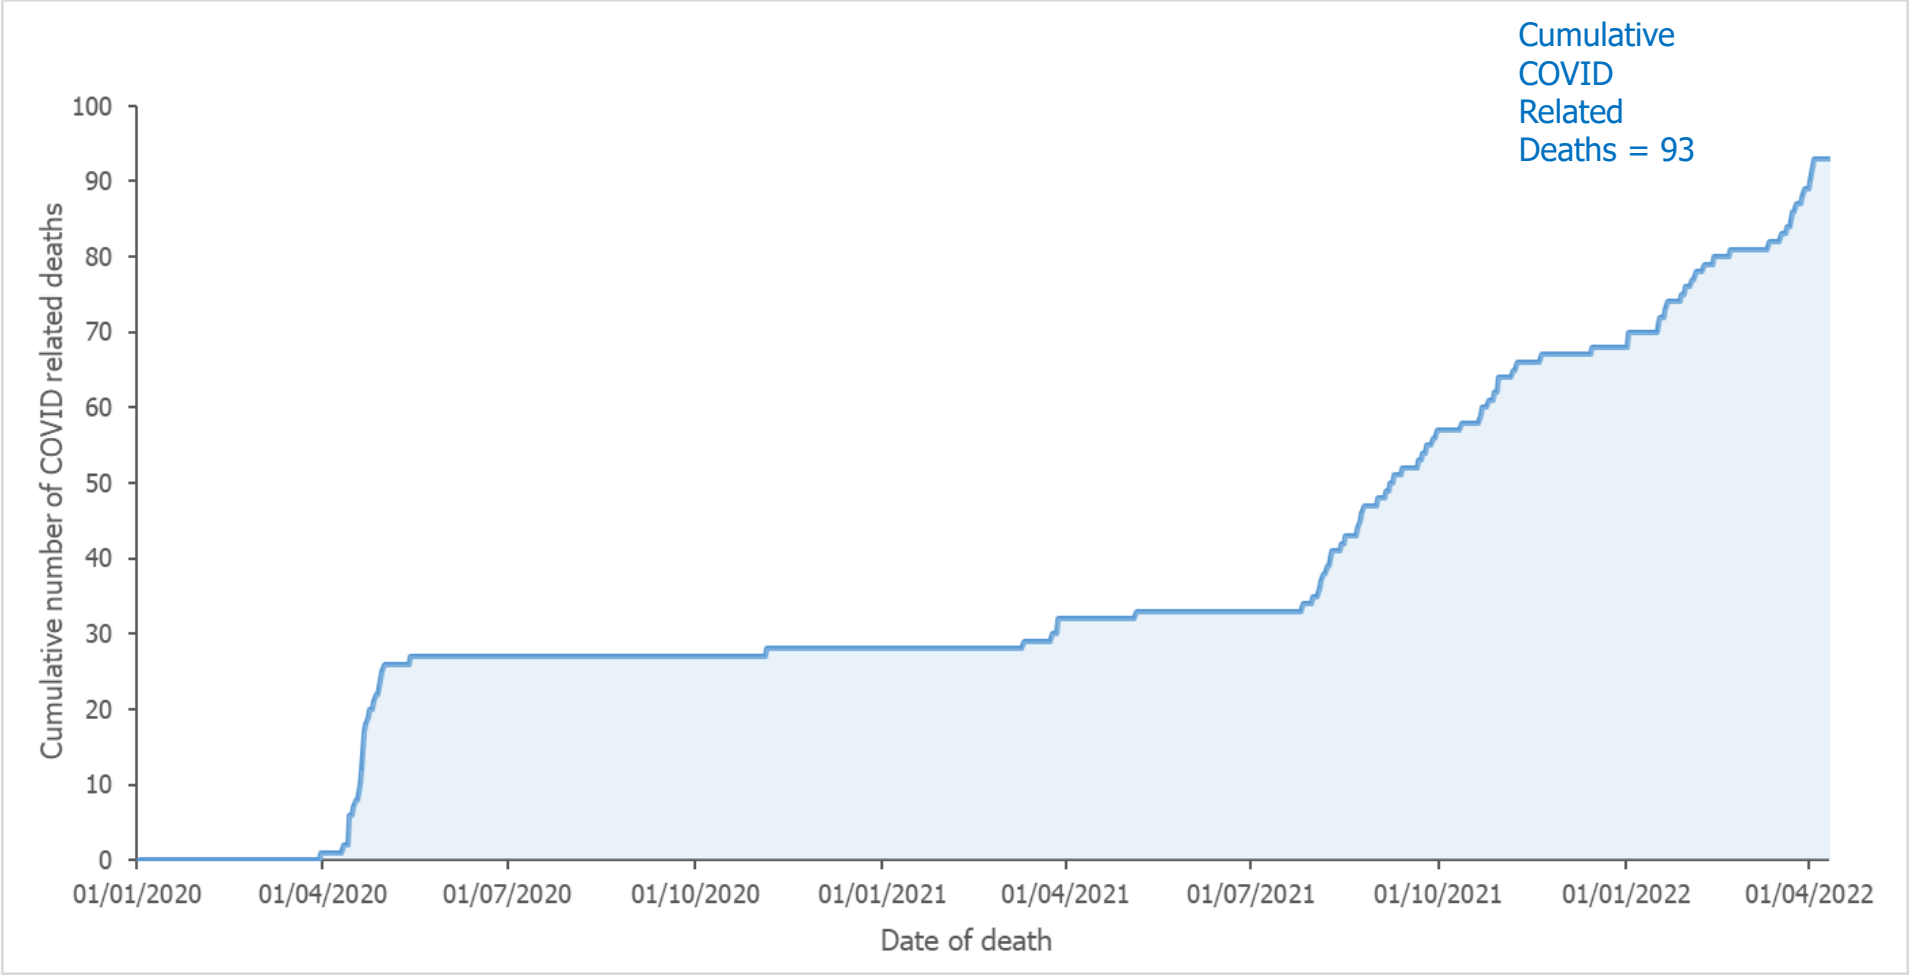

- *COVID related deaths are those where COVID-19 is mentioned **anywhere** within the death certificate. This differs from the definition used by Public Health England, who classify a COVID death as "people who had had a positive test result for COVID-19 and dies within 28 days of the first positive test result."

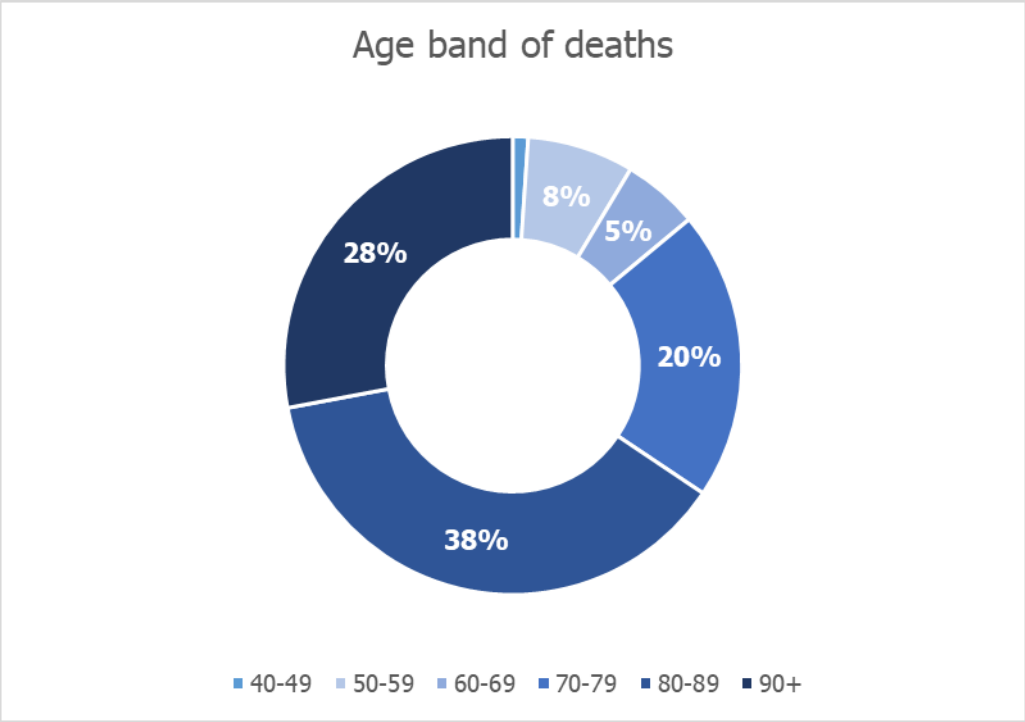

- **Death registrations are often delayed** and therefore deaths occurring in a given week may not be input into the week of which death occurred until a later date, meaning figures are likely to change retrospectively as data is updated. This also means that the most recent numbers will be incomplete at the time of release, and will update in subsequent reports.

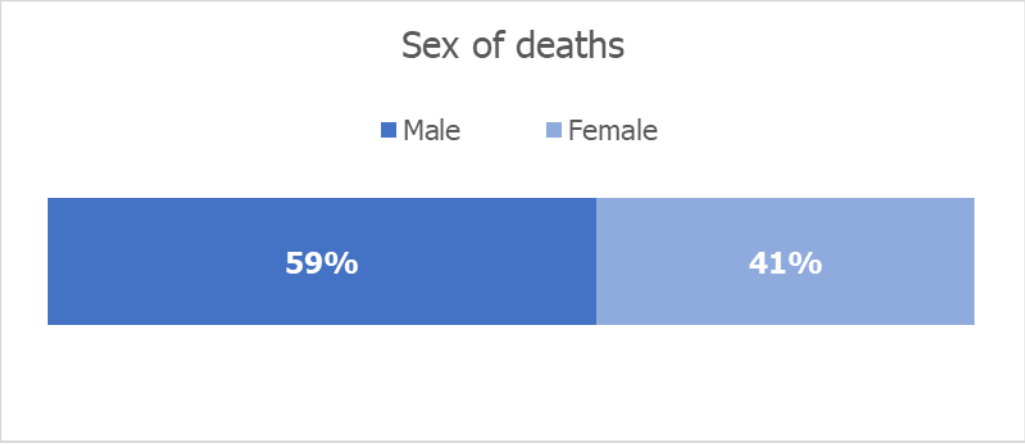

- Cumulative COVID-19 related deaths stands at 93.

Cumulative COVID-Related Deaths

COVID-Related Deaths Overview

Age band of deaths	No. of deaths	% of total deaths
40-49	1	1.1%
50-59	7	7.5%
60-69	5	5.4%
70-79	19	20.4%
80-89	35	37.6%
90+	26	28.0%

Arrivals Testing

From the 1st April, arrivals testing requirements are as follows:

As of 1 April 2022 there are no travel related restrictions on the Isle of Man.

You **do not** need to:

- complete a travel declaration form before you travel to the Isle of Man from abroad
- take any COVID-19 tests before you travel or after you arrive
- isolate when you arrive

This applies whether you are vaccinated or not.

Other countries may have rules about what you need to do to leave the country to travel to UK/ Isle of Man. You should check travel advice for the country you are travelling from.

Definitions

Vaccination Status

- One dose = those who have received only one dose
- Primary Course = those who have received a full course (two or three dose). Third dose, those with immunosuppression only.
- Primary Course + Booster = a full course plus a booster
