RSV Hospitalizations

The Oregon Health Authority conducts year round population-based surveillance for laboratory-confirmed hospitalizations associated with RSV in Clackamas, Multnomah, and Washington counties. To date, 335 hospitalizations have occurred during the 2025-2026 season. There were 3 hospitalizations reported during 04/19/2026 - 04/25/2026. The cumulative hospitalization rate for the 2025-2026 season is 18.5 per 100,000 people.

Published: 4/29/2026

Laboratory Data

Oregon met criteria for RSV season onset on January 10, 2026. As defined by CDC, the RSV season onset is the first of two consecutive weeks during which the mean percentage of specimens testing positive for RSV antigen is ≥10% or the mean percentage of specimens testing positive for RSV by PCR is ≥3%, whichever occurs first. 24 laboratories in Oregon and southwest Washington participate in sentinel laboratory surveillance by reporting the numbers of RSV tests conducted and the number positive.

0.0 % of antigen tests and 3.5 % of PCR tests were positive during 04/19/2026 - 04/25/2026.

Laboratory Data

Oregon met criteria for RSV season onset on January 10, 2026. As defined by CDC, the RSV season onset is the first of two consecutive weeks during which the mean percentage of specimens testing positive for RSV antigen is ≥10% or the mean percentage of specimens testing positive for RSV by PCR is ≥3%, whichever occurs first. 24 laboratories in Oregon and southwest Washington participate in sentinel laboratory surveillance by reporting the numbers of RSV tests conducted and the number positive.

4.5 % of antigen tests and 5.9 % of PCR tests were positive during 02/15/2026 - 02/21/2026 .

Laboratory Data

As defined by CDC, the RSV season onset is the first of two consecutive weeks during which the mean percentage of specimens testing positive for RSV antigen is ≥10% or the mean percentage of specimens testing positive for RSV by PCR is ≥3%, whichever occurs first. 24 laboratories in Oregon and southwest Washington participate in sentinel laboratory surveillance by reporting the numbers of RSV tests conducted and the number positive.

0.6 % of antigen tests and 0.3 % of PCR tests were positive during 10/12/2025 - 10/18/2025 .

RSV Hospitalizations

The Oregon Health Authority conducts year round population-based surveillance for laboratory-confirmed hospitalizations associated with RSV in Clackamas, Multnomah, and Washington counties. To date, 1 hospitalizations have occurred during the 2025-2026 season. There was 1 hospitalization reported during 10/05/2025 - 10/11/2025. The cumulative hospitalization rate for the 2025-2026 season is 0.1 per 100,000 people.
